Roll No. 36

Submitted to:

Dr. Rajani Chulyadyo
Department of Computer
Science and Engineering

Solve the Knapsack problem using the following strategies:

1. Brute-force method - Fractional Method

Pseudocode

Function KnapsackBruteforce(weights, values, capacity):

$n \leftarrow$ Length of weights (number of items)

$\text{max_value} \leftarrow 0$

$\text{best_combination} \leftarrow [0] * n$

 For each combination in all binary combinations of length n:

$\text{total_weight} \leftarrow 0$

$\text{total_value} \leftarrow 0$

 For i from 0 to n - 1:

$\text{total_weight} \leftarrow \text{total_weight} + (\text{weights}[i] * \text{combination}[i])$

$\text{total_value} \leftarrow \text{total_value} + (\text{values}[i] * \text{combination}[i])$

 If $\text{total_weight} \leq \text{capacity}$ AND $\text{total_value} > \text{max_value}$:

$\text{max_value} \leftarrow \text{total_value}$

$\text{best_combination} \leftarrow \text{combination}$

Return max_value , best_combination

2. Brute-force method - Fractional Method

Pseudocode

FUNCTION FractionalKnapsackBruteForce(weights, values, capacity):

$n \leftarrow \text{LENGTH}(\text{weights})$ // Number of items

$\text{max_value} \leftarrow 0$ // Maximum value found so far

$\text{best_fractions} \leftarrow [0] * n$ // Initialize fractions of items to take

 FUNCTION CalculateTotal(fractions):

$\text{total_weight} \leftarrow 0$

$\text{total_value} \leftarrow 0$

 FOR i FROM 0 TO $n - 1$:

$\text{total_weight} \leftarrow \text{total_weight} + (\text{weights}[i] * \text{fractions}[i])$

$\text{total_value} \leftarrow \text{total_value} + (\text{values}[i] * \text{fractions}[i])$

 return (total_weight , total_value)

 FUNCTION GenerateCombinations(current_fractions, index):

 IF $\text{index} = n$: // Base case: all items processed

 (total_weight , total_value) \leftarrow CalculateTotal(current_fractions)

 IF $\text{total_weight} \leq \text{capacity}$ AND $\text{total_value} > \text{max_value}$:

$\text{max_value} \leftarrow \text{total_value}$

$\text{best_fractions} \leftarrow \text{COPY}(\text{current_fractions})$

 return

 FOR frac FROM 0 TO 10:

$\text{current_fractions}[\text{index}] \leftarrow \text{frac} / 10$

 GenerateCombinations(current_fractions, $\text{index} + 1$)

 GenerateCombinations($[0] * n$, 0)

return (max_value , best_fractions)

3. Greedy method (Fractional Knapsack)

Pseudocode

```
FUNCTION FractionalKnapsack(capacity, items):  
    SORT items BY ratio IN descending order  
    total_value  $\leftarrow$  0.0  
    total_weight  $\leftarrow$  0  
    FOR each item IN items:  
        IF total_weight + item.weight  $\leq$  capacity:  
            total_value  $\leftarrow$  total_value + item.value  
            total_weight  $\leftarrow$  total_weight + item.weight  
        ELSE:  
            remaining_capacity  $\leftarrow$  capacity - total_weight  
            total_value  $\leftarrow$  total_value + item.value * (remaining_capacity / item.weight)  
            BREAK  
  
    return total_value
```

4. Dynamic programming (0/1 Knapsack)

Pseudocode

FUNCTION Knapsack01(weights, values, capacity):

$n \leftarrow$ Length of weights (number of items)

 Initialize a 2D DP table with $(n + 1)$ rows and $(\text{capacity} + 1)$ columns

$dp \leftarrow$ 2D array of size $(n + 1) \times (\text{capacity} + 1)$ initialized with 0

 // Fill the DP table

 FOR i FROM 1 TO n :

 FOR w FROM 1 TO capacity:

 IF $\text{weights}[i - 1] \leq w$:

 // Include the current item or exclude it, take the maximum

$dp[i][w] \leftarrow \text{MAX}(\text{values}[i - 1] + dp[i - 1][w - \text{weights}[i - 1]], dp[i - 1][w])$

 ELSE:

 // Exclude the current item

$dp[i][w] \leftarrow dp[i - 1][w]$

 //Return the maximum value that can be achieved

 return $dp[n][\text{capacity}]$
